# Am27S191/S191A/S191SA/PS191/PS191A Am27S291/S291A/S291SA/PS291/PS291A

- · Fast access time allows high system speed
- 50% power savings on deselected parts enhances reliability through total system heat reduction (27PS devices)
- Plug in replacement for industry standard product no board changes required
- Platinum-Silicide fuses guarantee high reliability, fast programming and exceptionally high programming yields (typ > 98%)

Advanced

Micro

Devices

- Voltage and temperature compensated providing extremely flat AC performance over military range
- Rapid recovery from power-down state provides minimum delay (27PS devices)

## **GENERAL DESCRIPTION**

The Am27S191 (2048 words by 8 bits) is a Schottky TTL Programmable Read-Only Memory (PROM).

This device has three-state outputs which are compatible with low-power Schottky bus standards capable of satisfying the requirements of a variety of microprogrammable controls, mapping functions, code conversion, or logic replacement. Easy word-depth expansion is facilitated by both active LOW ( $\overline{G_1}$ ) and active HIGH ( $G_2$  and  $G_3$ ) output enables.

This device is also available in 300-mil, lateral center DIP (Am27S291). Additionally, this device is offered in a powerswitched, three-state version (Am27PS191/Am27PS291).

## PIN DESCRIPTION

#### A0-A10 Address Inputs (Input)

The 11-bit field presented at the address inputs selects one of 2048 memory locations to be read from.

## Q<sub>0</sub>-Q<sub>7</sub> Data Output Port (Output)

The outputs whose state represents the data read from the selected memory locations.

## G1, G2, G3 Output Enable (input)

Provides direct control of the Q-output buffers. Outputs disabled forces all open-collector outputs to an "OFF" state

## FUNCTIONAL DESCRIPTION

#### Notes on Power Switching

The Am27PS191 and Am27PS291 are power-switched devices. When the chip is selected, important internal currents increase from small idling or standby values to their larger selected values. This transition occurs very rapidly, meaning that access times from the powered-down state are only slightly slower than from the powered-up state. Deselected,  $I_{CC}$  is reduced to less than half its full operating amount. Due to this unique feature, there are special considerations which should be followed in order to optimize performance:

and all three-state outputs to a floating or high-impedance state.

Enable = 
$$\overline{G_1} \cdot G_2 \cdot G_3$$
  
Disable =  $\overline{G_1} \cdot G_2 \cdot G_3$   
=  $G_1 + \overline{G_2} + \overline{G_3}$ 

V<sub>CC</sub> Device Power Supply Pin The most positive of the logic power supply pins.

GND Device Power Supply Pin

The most negative of the logic power supply pins.

- 1. When the Am27PS191 and Am27PS291 are selected, a current surge is placed on the V<sub>CC</sub> supply due to the powerup feature. In order to minimize the effects of this current transient, it is recommended that a  $0.1\mu$  ceramic capacitor be connected from pin 24 to pin 12 at each device. (See Figure 1.)
- Address access time (TAVQV) can be optimized if a chip enable set-up time (TEVAV) of greater than 25ns is observed. Negative set-up times on chip enable (TEVAV < 0) should be avoided. (For typical and worse case characteristics, see Figures 2A and 2B.)

# ABSOLUTE MAXIMUM RATINGS

Storage Temperature65 to + 150°C Ambient Temperature with
Power Applied55 to +125°C
Supply Voltage0.5 V to +7.0 V
DC Voltage Applied to Outputs
(Except During Programming)0.5 V to +V <sub>CC</sub> Max.
DC Voltage Applied to Outputs
During Programming
Output Current into Outputs During
Programming (Max. Duration of 1 sec)
DC Input Voltage0.5 V to +5.5 V
DC Input Current30 mA to +5 mA

Stresses above those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.

**OPERATING RANGES** 

Commercial (C) Devices
Ambient Temperature (TA)0 to +75°C
Supply Voltage (V <sub>CC</sub> ) + 4.75 V to + 5.25 V
Military (M) Devices*
Case Temperature (T <sub>C</sub> )55 to +125°C
Supply Voltage (V <sub>CC</sub> ) +4.5 V to +5.5 V

Operating ranges define those limits between which the functionality of the device is quaranteed.

\*Military product 100% tested at  $T_{C} = +25^{\circ}C_{c} + 125^{\circ}C_{c}$ and -55°C.

DC CHARACTERISTICS over operating ranges unless of	otherwise specified (for APL Products, Group A,
Subgroups 1, 2, 3 are tested unless otherwise noted)	

Parameter Symbol	Parameter Description	Test Conditions		Min.	Тур.	Max.	Unit
V <sub>OH</sub> (Note 1)	Output HIGH Voltage	V <sub>CC</sub> = Min., I <sub>OH</sub> = -2.0 mA V <sub>IN</sub> = V <sub>IH</sub> or V <sub>IL</sub>		2.4			v
VOL	Output LOW Voltage	$V_{CC} = Min., i_{OL} = 16 mA$ $V_{IN} = V_{IH} \text{ or } V_{IL}$				0.50	v
V <sub>IH</sub>	Input HIGH Level	Guaranteed input logical HIGH voltage for all inputs (Note 3)		2.0			v
VIL	Input LOW Level	Guaranteed input logical LOW voltage for all inputs (Note 3)				0.8	۷
l <sub>IL</sub>	Input LOW Current	V <sub>CC</sub> = Max., V <sub>IN</sub> = 0.45 V				- 0.250	mA
ſн	Input HIGH Current	V <sub>CC</sub> = Max., V <sub>IN</sub> = V <sub>CC</sub>				40	μA
	Output Short-Circuit	V <sub>CC</sub> = Max., V <sub>OUT</sub> = 0.0 V	COM'L	- 20		~ 90	mA
Isc	Current	(Note 1)	MIL	- 15		- 90	
lcc	Power Supply Current	All inputs = GND, V <sub>CC</sub> = Max.				185	mA
Vi	Input Clamp Voltage	V <sub>CC</sub> = Min., I <sub>IN</sub> = -18 mA				- 1.2	v
		V <sub>CC</sub> = Max.	Vo = Vcc	1		40	
ICEX	Output Leakage Current	$V_{G_1} = 2.4 V$	V <sub>O</sub> = 0.4 V			-40	μA
CIN	Input Capacitance	V <sub>IN</sub> = 2.0 V @ f = 1 MHz (Note 2) V <sub>CC</sub> = 5 V, T <sub>A</sub> = 25°C	• •		4.0		٥F
COUT	Output Capacitance	$V_{OUT} = 2.0 V @ f = 1 MHz (Note 2) V_{CC} = 5 V, T_A = 25^{\circ}C$			8.0		pr

Notes: 1. Not more than one output should be shorted at a time. Duration of the short-circuit test should not be more than one second.
2. These parameters are not 100% tested, but are evaluated at initial characterization and at any time the design is modified where capacitance may be affected.
3. V<sub>IL</sub> and V<sub>IH</sub> are input conditions of output tests and are not themselves directly tested. V<sub>IL</sub> and V<sub>IH</sub> are absolute voltages with respect to device ground and include all overshoots due to system and/or tester noise. Do not attempt to test these values without suitable equipment.

SWITCHING CHARACTERISTICS over operating ranges unless otherwise specified (for APL Products, Group A. Subgroups 9, 10, 11 are tested unless otherwise noted\*)

. ....

Parameter No. Symbol				Am27S	Am27S Version		Am27PS Version	
	Parameter Description	Version	COM'L	MIL Max.	COM'L Max.	MIL. Max.	Unit

4 TAVQV1	QV1 Valid Access Time (Am27PS Versions - only)	STD			80	90	ns	

See also Switching Test Circuits.

See also Switching Test Circuits.
Notes: 1. Tests are performed with input transition time of 5 ns or less, timing reference levels of 1.5 V, and input pulse levels of 0 to 3.0 V.
2. TGVQZ is measured at steady state HIGH output voltage -0.5 V and steady state LOW output voltage +0.5 V output levels.
3. TAVQV is tested with S<sub>1</sub> closed and C<sub>L</sub> = 50 pF.
4. TGVQZ is tested with C<sub>L</sub> = 50 pF to the 1.5 V level; S<sub>1</sub> is open for high impedance to HIGH tests and closed for high impedance to LOW tests. TGVQZ is tested with C<sub>L</sub> = 5 pF. HIGH to high impedance tests are made with S<sub>1</sub> open to an output voltage of steady state HIGH -0.5 V with S<sub>1</sub> open; LOW-to-HIGH impedance tests are made to the steady state LOW +0.5 V level with S<sub>1</sub> closed.

\*Subgroups 7 and 8 apply to functional tests.
