

Adjustable Current Limited Load Switch with Fault Flag

General Description

The AAT4614 SmartSwitch is a current limited P-channel MOSFET power switch designed for high side load switching applications. This switch operates with inputs ranging from 2.4V to 5.5V, making it ideal for both 3V and 5V systems. An integrated current-limiting circuit protects the input supply against large currents which may cause the supply to fall out of regulation. Reverse current blocking is provided to protect the load switch from reverse current potentials while the device is shutdown.

The AAT4614 is also protected from thermal overload which is limited by power dissipation and junction temperatures. Current limit threshold is programmed with a resistor from SET to ground and may be adjusted for levels up to 1.4A. The ultra-fast current limit response to a sudden short circuit is a mere 1 μ s which reduces the requirements of local supply bypassing. An open drain FAULT flag signals an over-current or over-temperature condition after a 4ms blanking time to prevent false reporting. Quiescent current is a low 10 μ A and the supply current decreases to less than 1 μ A in shutdown mode.

The AAT4614 is offered in the small Pb-free, 8-pin SC70JW, SOT23-6 and SOT23-5 packages, and is specified for operation over the -40°C to +85°C ambient temperature range.

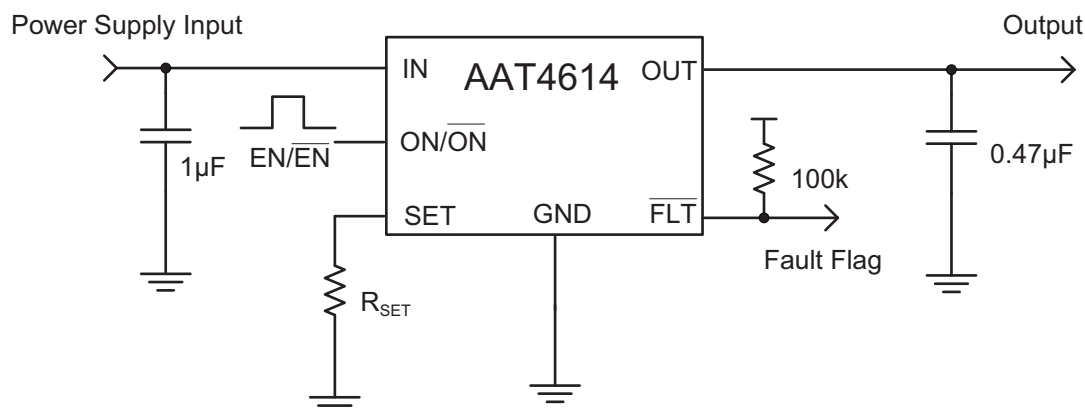

Features

- Input Voltage Range: 2.4V to 5.5V
- Programmable Over-Current Threshold
- Fast Transient Response:
 - 1 μ s Response to Short Circuit
- Low Quiescent Current
 - 10 μ A Typical while Enabled
 - 1 μ A Max with Switch Off ($T_A = 25^\circ\text{C}$)
- 130m Ω Typical $R_{DS(ON)}$
- Only 2.4V Needed for ON/OFF Control
- Under-Voltage Lockout
- Reverse Blocking During Disable
- 4ms Fault Blanking
- Fault Flag Open Drain Output (Not Available for SOT23-5 Package)
- Active Hi/Lo Enable Options
- Over-Temperature Protection
- 4kV ESD Rating
- 6-Pin SOT23, 5-Pin SOT23, or 8-Pin SC70JW Package
- Temperature Range: -40°C to +85°C

Applications

- Hot Swap Supplies
- Notebook Computers
- Portable Products
- Proprietary Peripheral Ports
- USB Ports

Typical Application

AAT4614

Adjustable Current Limited Load Switch with Fault Flag

Pin Description

Pin #			Symbol	Description
SOT23-6	SOT23-5	SC70JW-8		
1	1	5	OUT	Current limiting load switch output (high side P-channel MOSFET Drain). Connect a 0.47 μ F capacitor from OUT to GND for best load transient response.
2	2	6,7,8	GND	IC ground connection
3	n/a	1	FLT	Current limit fault flag pin, open-drain output, active low signal. Pull up with a 10k Ω to 100k Ω resistor.
4	4	2	ON/ $\overline{\text{ON}}$	Load switch enable input. Active high and active low options are available.
5	3	3	SET	Current limit set pin. Connect a resistor between this pin and ground to program the desired current limit set point.
6	5	4	IN	Load switch power supply input pin (high side P-channel MOSFET source). Bypass with a 1 μ F capacitor from IN to GND.

Adjustable Current Limited Load Switch with Fault Flag

Functional Block Diagram

Functional Description

The AAT4614 is a single channel current limiting load switch that is intended to protect against short circuit and over current events by current limiting to a preset level. This device also provides a reverse current blocking feature, on / off enable control, and a fault flag to notify a system controller of an over current, short circuit or over temperature event.

In the event of a load current exceeding a user programmed current limit level (I_{LIM}), a high speed current limit loop limits the current in a microsecond and will reset to low impedance once the short-circuit condition is removed. The AAT4614 is internally protected from thermal damage by an over-temperature detection circuit. If the die temperature reaches the internal thermal limit, the power device is switched off until the die temperature cools to a level below the thermal limit threshold. This device may operate in a thermal cycling state indefinitely or until the over-current condition is removed.

The AAT4614 operates with input voltages ranging from 2.4V to 5.5V which, along with its extremely low operating current, makes it ideal for battery-powered applications. In cases where the input voltage drops below 2.4V, the AAT4614 MOSFET is protected from entering the saturated region of operation by being automatically shutting down via an under-voltage lockout circuit.

Current limit or over temperature conditions are reported by the open drain FAULT output. A 4ms blanking interval prevents false reporting during the charging of a capacitive load, which typically occurs during device turn-on, but may also occur during a port hot plug-in event. The AAT4614 is ideally suited for protection of peripheral ports such as USB, RS232, and parallel ports.

Reverse Current Blocking

The AAT4614's reverse current blocking feature prevents current to flow from OUT to IN when the device is disabled. When the device is enabled, the electrical characteristics between IN and OUT is still similar to an ideal switch; current can flow in either direction.

Adjustable Current Limited Load Switch with Fault Flag

Application Information

Setting the Current Limit

In most applications, the variation in I_{LIM} must be taken into account when determining R_{SET} . The I_{LIM} variation is due to processing variations from part to part, as well as variations in the voltages at IN and OUT, plus the operating temperature. Together, these three factors add up to a $\pm 25\%$ tolerance (see I_{LIM} specification in "Electrical Characteristics" section). Figure 1 illustrates a cold device with a statistically higher current limit and a hot device with a statistically lower current limit, both with R_{SET} equal to $10.5k\Omega$. While the chart, " R_{SET} vs. I_{LIM} " indicates an I_{LIM} of $0.7A$ with an R_{SET} of $10.5k\Omega$, this figure shows that the actual current limit will be at least $0.525A$ and no greater than $0.875A$.

Figure 1: Current Limit at High and Low Temperature Using $10.5k\Omega$

To determine R_{SET} , start with the application required current limit as the minimum current limit value and multiply it by 1.33 to derive the typical current limit value. Next, refer to Table 1 to find the approximate R_{SET} value. For greater precision, use the small current limit range linear approximation to calculate R_{SET} value. For example, for 500mA current limit requirement, first calculate the typical current limit: $500 \cdot 1.33 = 665mA$. Then refer to Table 1; the nearest small current limit range is 600mA to 700mA with 100mA current limit interval and $0.45kV R_{SET}I_{LIM}$ coefficient interval. Then adopt the method of linear approximation in small range to calculate the $R_{SET}I_{LIM}$ coefficient.

$$R_{SET} \cdot I_{LIM} = 7.8 - \frac{0.45 \cdot (665 - 600)}{100} = 7.51kV$$

So,

$$R_{SET} = \frac{7.51kV}{665mA} = 11.3k\Omega$$

R_{SET} (k Ω)	I_{LIM} Typ. (mA)	$R_{SET} \cdot I_{LIM}$ Coefficient (kV)
16.2	500	8.10
14.7	550	8.09
13.0	600	7.80
10.5	700	7.35
8.87	800	7.10
7.50	900	6.75
6.81	1000	6.81
6.04	1100	6.64
5.49	1200	6.59
4.99	1300	6.49
4.64	1400	6.50

Table 1: Current Limit Standard R_{SET} Values.

Input Capacitor

The input capacitor C_{IN} protects the power supply from current transients generated by the load attached to the AAT4614. When a short circuit is suddenly applied to the output of the AAT4614, a large current, limited only by the $R_{DS(ON)}$ of the MOSFET, will flow for less than $1\mu s$ before the current limit circuitry activates. (See the curve "Short Circuit Through 0.3Ω " in the "Typical Characteristics" section of this datasheet.) In this event, a moderately sized C_{IN} will dramatically reduce the voltage transient seen by the power supply and by other circuitry upstream from the AAT4614. The extremely fast short-circuit response time of the AAT4614 reduces the size requirement for C_{IN} .

C_{IN} should be located as close to the device VIN pin as practically possible. Ceramic, tantalum, or aluminum electrolytic capacitors are appropriate for C_{IN} . There is no specific capacitor ESR requirement for C_{IN} . However, for higher current operation, ceramic capacitors are recommended for C_{IN} due to their inherent capability over tantalum capacitors to withstand input current surges from low impedance sources such as batteries in portable devices.

Adjustable Current Limited Load Switch with Fault Flag

Output Capacitor

In order to insure stability while current limit is active, a low capacitance (approximately 0.47μF) is required. No matter how large the output capacitor, output current is limited to the value set by the AAT4614 current limiting circuitry, so very large output capacitors can be used.

For example, USB ports are specified to have at least 120μF of capacitance downstream from their controlling power switch. The current limiting circuit will allow an output capacitance of 1000μF or more without disturbing the upstream power supply.

ON/ $\overline{\text{ON}}$ (Enable Input)

In many systems, power planes are controlled by integrated circuits which run at lower voltages than the power planes themselves. The enable input (ON) of the AAT4614 has low and high threshold voltages that accommodate this condition. The threshold voltages are compatible with 5V TTL and 2.5V to 5V CMOS systems. Both active high and active low options are available for all packages.

Connecting to Capacitive Load

When switching the AAT4614 onto a capacitive load, the AAT4614 will charge the output capacitive load at a rate no greater than the current limit setting.

FAULT Output

The FAULT Flag ($\overline{\text{FLT}}$) is provided to alert the system if an AAT4614 load is not receiving sufficient voltage to operate properly. If current limit or over-temperature circuits in any combination are active for more than approximately 4ms, the FAULT Flag is pulled to ground through an approximately 100Ω resistor. The filtering of voltage or current transients of less than 4ms prevents capacitive loads connected to the AAT4614 output from activating the FAULT Flag when they are initially attached. Pull-up resistances of 1kΩ to 100kΩ are recommended. Since $\overline{\text{FLT}}$ is an open drain terminal, it may be pulled up to any unrelated voltage less than the maximum operating voltage of 5.5V, allowing for level shifting between circuits. The $\overline{\text{FLT}}$ Pin is not available for the SOT23-5 package.

Thermal Considerations

Since the AAT4614 has internal current limit and over-temperature protection, junction temperature is rarely a concern. However, if the application requires large currents in a hot environment, it is possible that temperature, rather than current limit, will be the dominant regulating condition. In these applications, the maximum current available without risk of an over-temperature condition must be calculated. The maximum internal temperature while current limit is not active can be calculated using Equation 1.

$$\text{Eq. 1: } T_{J(\text{MAX})} = I_{\text{MAX}}^2 \cdot R_{\text{DS(ON)(MAX)}} \cdot R_{\theta\text{JA}} + T_{A(\text{MAX})}$$

In Equation 1, I_{MAX} is the maximum current required by the load. $R_{\text{DS(ON)(MAX)}}$ is the maximum rated $R_{\text{DS(ON)}}$ of the AAT4614 at high temperature. $R_{\theta\text{JA}}$ is the thermal resistance between the AAT4614 die and the board onto which it is mounted. $T_{A(\text{MAX})}$ is the maximum temperature that the PCB under the AAT4614 would be if the AAT4614 were not dissipating power. Equation 1 can be rearranged to solve for I_{MAX} , as shown in Equation 2.

$$\text{Eq. 2: } I_{\text{MAX}} = \sqrt{\frac{T_{\text{SD(MIN)}} - T_{A(\text{MAX})}}{R_{\text{DS(ON)(MAX)}} \cdot R_{\theta\text{JA}}}}$$

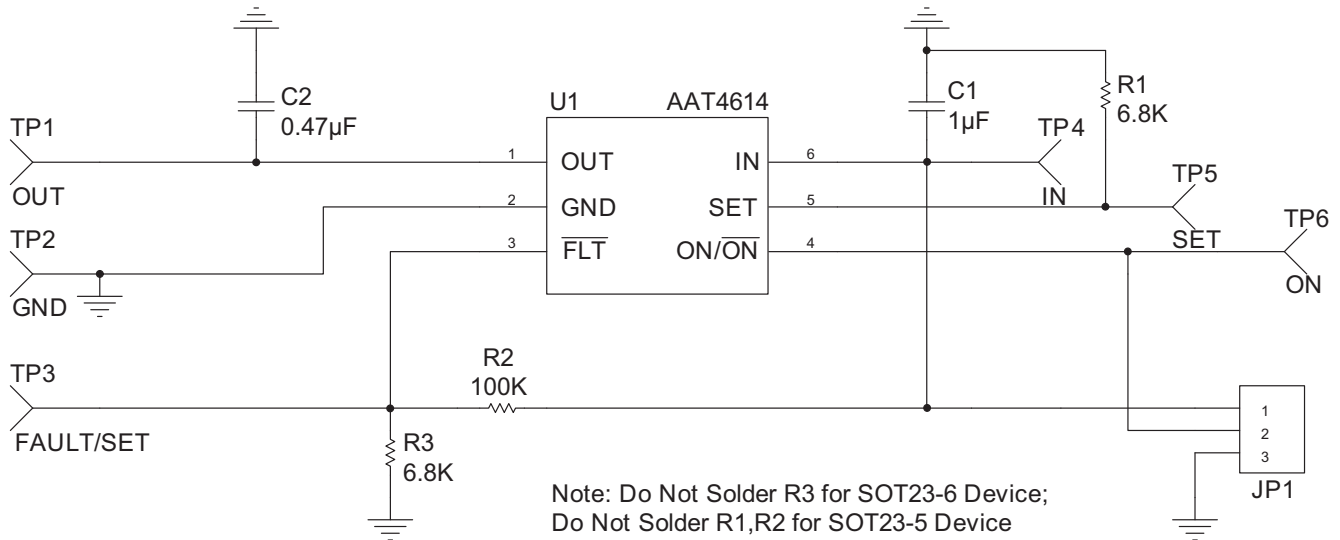

$T_{\text{SD(MIN)}}$ is the minimum temperature required to activate the AAT4614's over-temperature protection. With the typical specification of 125°C, 115°C is a safe minimum value to use.

For example, if an application is specified to operate in 50°C environments, the PCB operates at temperatures as high as 85°C. The application is sealed and its PCB is small, causing $R_{\theta\text{JA}}$ to be approximately 150°C/W. Using Equation 2,

$$\text{Eq. 3: } I_{\text{MAX}} = \sqrt{\frac{115 - 85}{0.23 \cdot 150}} = 0.93(\text{A})$$
