

### FEATURES

- Low Input Offset Voltage ..... **75 $\mu$ V Max**
- Low Offset Voltage Drift,  
Over  $-55^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$  ..... **0.5 $\mu$ V/ $^{\circ}\text{C}$  Max**
- Low Supply Current (Per Amplifier) ..... **725 $\mu$ A Max**
- High Open-Loop Gain ..... **5000V/mV Min**
- Low Input Bias Current ..... **2nA Max**
- Low Noise Voltage Density ..... **11nV/ $\sqrt{\text{Hz}}$  at 1kHz**
- Stable With Large Capacitive Loads ..... **10nF Typ**
- Pin Compatible to OP-14, OP-221, LM158, MC1458/1558,  
and LT1013 With Improved Performance
- Available in Die Form

\* For devices processed in total compliance to MIL-STD-883, add /883 after part number. Consult factory for 883 data sheet.

<sup>†</sup> Burn-in is available on commercial and industrial temperature range parts in CerDIP, plastic DIP, and TO-can packages.

<sup>††</sup> For availability and burn-in information on SO and PLCC packages, contact your local sales office.

### GENERAL DESCRIPTION

The OP-200 is the first monolithic dual operational amplifier to offer OP-77 type precision performance. Available in the industry standard 8-pin pinout, the OP-200 combines precision performance with the space and cost savings offered by a dual amplifier.

The OP-200 features an extremely low input offset voltage of less than 75 $\mu$ V with a drift below 0.5 $\mu$ V/ $^{\circ}\text{C}$ , guaranteed over the

### PIN CONNECTIONS

### EPOXY MINI-DIP (P-Suffix) 8-PIN HERMETIC DIP (Z-Suffix)

### SIMPLIFIED SCHEMATIC (One of two amplifiers is shown.)

# OP200

full military temperature range. Open-loop gain of the OP-200 exceeds 5,000,000 into a 10k $\Omega$  load; input bias current is under 2nA; CMR is over 120dB and PSRR below 1.8 $\mu$ V/V. On-chip zener-zap trimming is used to achieve the extremely low input offset voltage of the OP-200 and eliminates the need for offset nulling.

Power consumption of the OP-200 is very low, with each amplifier drawing less than 725 $\mu$ A of supply current. The total current drawn by the dual OP-200 is less than one-half that of a single OP-07, yet the OP-200 offers significant improvements over this industry standard op amp. The voltage noise density of the OP-200, 11nV/ $\sqrt{\text{Hz}}$  at 1kHz, is half that of most competitive devices.

The OP-200 is pin compatible with the OP-14, OP-221, LM158, MC1458/1558, and LT1013 and can be used to upgrade systems using these devices. The OP-200 is an ideal choice for applications requiring multiple precision op amps and where low power consumption is critical.

For a quad precision op amp, see the OP-400.

## ABSOLUTE MAXIMUM RATINGS (Note 1)

### NOTES:

1. Absolute maximum ratings apply to both DICE and packaged parts, unless otherwise noted.
2.  $\theta_{JA}$  is specified for worst case mounting conditions, i.e.,  $\theta_{JA}$  is specified for device in socket for CerDIP, P-DIP, and LCC packages;  $\theta_{JA}$  is specified for device soldered to printed circuit board for SOL package.

# OP200

## TYPICAL PERFORMANCE CHARACTERISTICS

## APPLICATIONS INFORMATION

The OP-200 is inherently stable at all gains and is capable of driving large capacitive loads without oscillating. Nonetheless, good supply decoupling is highly recommended. Proper supply decoupling reduces problems caused by supply line noise and improves the capacitive load driving capability of the OP-200.

## APPLICATIONS

### DUAL LOW-POWER INSTRUMENTATION AMPLIFIER

A dual instrumentation amplifier that consumes less than 33mW of power per channel is shown in Figure 1. The linearity of the instrumentation amplifier exceeds 16 bits in gains of 5 to 200 and is better than 14 bits in gains from 200 to 1000. CMRR is above 115dB (Gain = 1000). Offset voltage drift is typically  $0.2\mu\text{V}/^\circ\text{C}$  over the military temperature range which is comparable to the best monolithic instrumentation amplifiers. The

FIGURE 1: Dual Low-Power Instrumentation Amplifier

bandwidth of the low-power instrumentation amplifier is a function of gain and is shown below:

| GAIN | BANDWIDTH |
|------|-----------|
| 5    | 150kHz    |
| 10   | 67kHz     |
| 100  | 7.5kHz    |
| 1000 | 500Hz     |

The output signal is specified with respect to the reference input, which is normally connected to analog ground. The reference input can be used to offset the output from  $-10\text{V}$  to  $+10\text{V}$  if required.

### PRECISION ABSOLUTE VALUE AMPLIFIER

The circuit of Figure 2 is a precision absolute value amplifier with an input impedance of  $10\text{M}\Omega$ . The high gain and low  $\text{TCV}_{\text{OS}}$  of the OP-200 insure accurate operation with microvolt

FIGURE 2. Precision Absolute Value Amplifier

FIGURE 4. Dual 12-Bit Voltage Output DAC

input signals. In this circuit, the input always appears as a common-mode signal to the op amps. The CMR of the OP-200 exceeds 120dB, yielding an error of less than 2ppm.

### PRECISION CURRENT PUMP

Maximum output current of the precision current pump shown in Figure 3 is  $\pm 10\text{mA}$ . Voltage compliance is  $\pm 10\text{V}$  with  $\pm 15\text{V}$  supplies. Output impedance of the current transmitter exceeds  $3\text{M}\Omega$  with linearity better than 16 bits.

FIGURE 3. Precision Current Pump

### DUAL 12-BIT VOLTAGE OUTPUT DAC

The dual output DAC shown in Figure 4 is capable of providing untrimmed 12-bit accurate operation over the entire military temperature range. Offset voltage, bias current and gain errors of the OP-200 contribute less than 1/10 of an LSB error at 12 bits over the military temperature range.

# OP200

## DUAL PRECISION VOLTAGE REFERENCE

A dual OP-200 and a REF-43, a 2.5V voltage reference, can be used to build a  $\pm 2.5V$  precision voltage reference. Maximum output current from each reference is  $\pm 10mA$  with load regulation under  $25\mu V/mA$ . Line regulation is better than  $15\mu V/V$  and output voltage drift is under  $20\mu V/^{\circ}C$ . Output voltage noise from 0.1Hz to 10Hz is typically  $75\mu V_{p-p}$ . R1 and D1 insure correct start-up.

## PROGRAMMABLE HIGH RESOLUTION WINDOW COMPARATOR

The programmable window comparator shown in Figure 6 is easily capable of 12-bit accuracy over the full military temperature range. A dual CMOS 12-bit DAC, the DAC-8212, is used in the voltage switching mode to set the upper and lower thresholds (DAC A and DAC B, respectively).
