2.5V/3.3V SiGe Differential Receiver/Driver with RSECL* Outputs

*Reduced Swing ECL

Description

The NBSG16 is a differential receiver/driver targeted for high frequency applications. The device is functionally equivalent to the EP16 and LVEP16 devices with much higher bandwidth and lower EMI capabilities.

Inputs incorporate internal 50 Ω termination resistors and accept NECL (Negative ECL), PECL (Positive ECL), HSTL, LVTTTL, LVC MOS, CML, or LVDS. Outputs are RSECL (Reduced Swing ECL), 400 mV.

The V_{BB} and V_{MM} pins are internally generated voltage supplies available to this device only. The V_{BB} is used as a reference voltage for single-ended NECL or PECL inputs and the V_{MM} pin is used as a reference voltage for LVC MOS inputs. For all single-ended input conditions, the unused complementary differential input is connected to V_{BB} or V_{MM} as a switching reference voltage. V_{BB} or V_{MM} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{MM} via a 0.01 μ F capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} and V_{MM} outputs should be left open.
