DESCRIPTION

The TC55257APL is 262,144 bit static random access memory organized as 32,768 words by 8 bits using CMOS technology, and operated from a single 5V supply. Advanced circuit techniques provide both high speed and low power features with a operating current of 5mA/MHz (Typ.) and minimum cycle time of 85ns. When $\overline{CE}$ is a logical high, the device is placed in low power standby mode in which standby current is 2μA typically. The TC55257APL has two control inputs. Chip enable ($\overline{CE}$) allow for device selection and data retention control, and an output enable input ($\overline{OE}$) provides fast memory access. Thus the TC55257APL is suitable for use in various microprocessor application systems where high speed, low power, and battery back up are required. The TC55257APL is offered in both a standard dual-in-line 28 pin plastic package (0.6 inch width) and small-out-line plastic flat package.

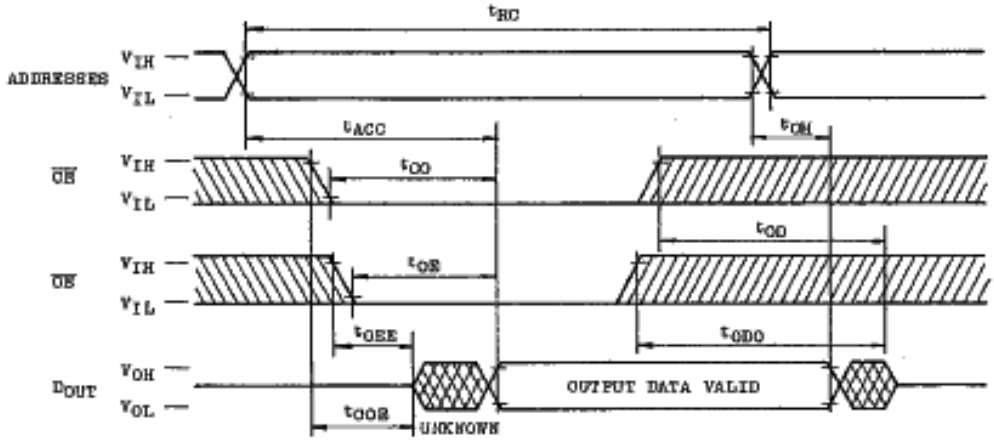
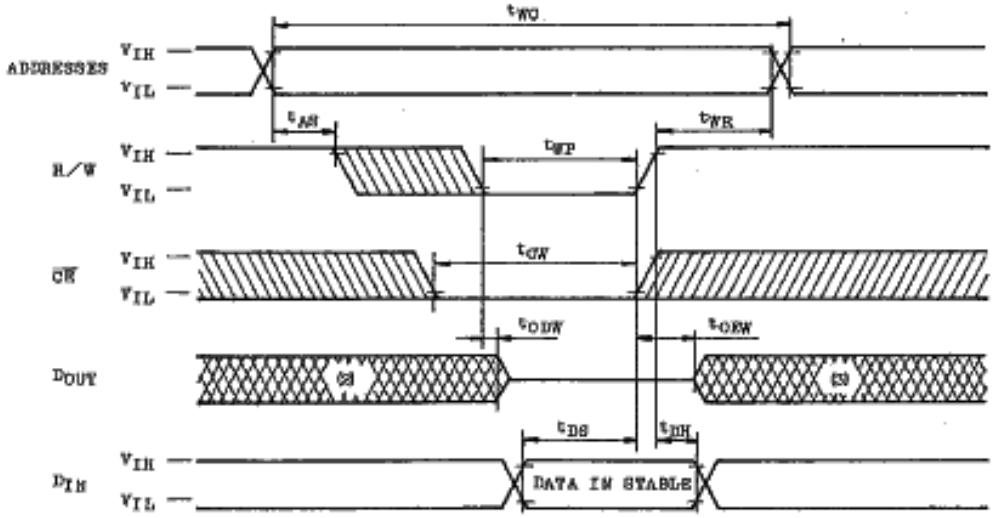
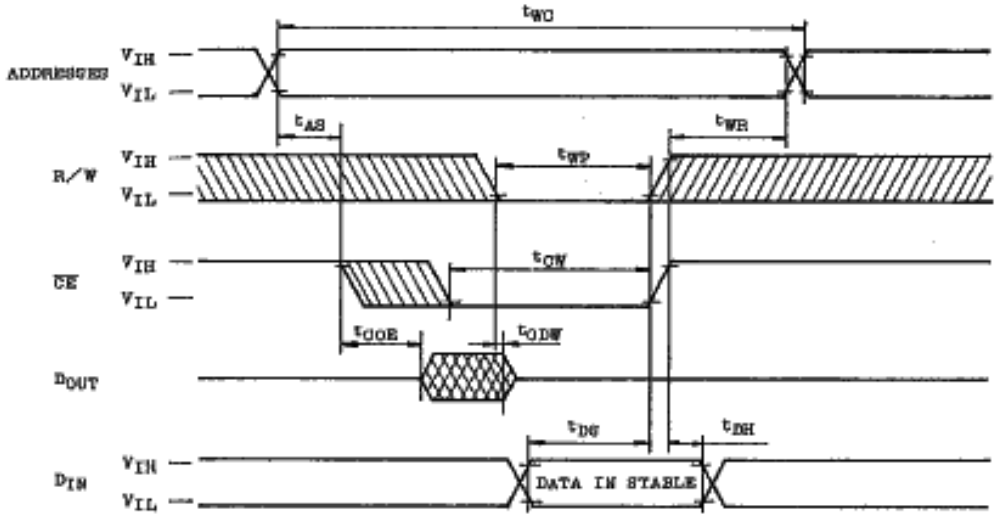
READ CYCLE (1)



WRITE CYCLE 1 (4) (R/W Controlled Write)



WRITE CYCLE 2 (4) ($\overline{CE}$ Controlled Write)



Note: 1. R/W is High for Read Cycle.

2. Assuming that $\overline{CE}$ low transition occurs coincident with or after R/W Low transition, Outputs remain in a high impedance state.

3. Assuming that $\overline{CE}$ High transition occurs coincident with or prior to R/W High transition, Outputs remain in a high impedance state.

4. Assuming that $\overline{OE}$ is High for Write Cycle, Outputs are in high impedance state during this period.
