## 1. Introduction

---

This Grove-125KHz RFID Reader is a module used to read uem4100 RFID card information with two output formats: Uart and Wiegand. It has a sensitivity with maximum 7cm sensing distance. There is also [the electronic brick version](#) of this module. It can help you with project like internet of thing and access control system.

And you should use these module below while using RFID reader:

- [RFID tag combo \(125khz\)](#)

## 2. Specifications

---

Voltage:	4.75-5.25V
Working Frequency	125 KHz
Sensing Distance(Max):	70mm
TTL Output	9600 baudrate, 8 data bits, 1 stop bit, and no verify bit
Wiegand Output	26 bits Wiegand format, 1 even verify bit, 24 data bits, and 1 odd verify bit

### 3. Demonstration

---

Here we show how to read RFID information using the Grove - 125KHz RFID Reader. Connect Grove - 125KHz RFID Reader to UART of Grove - Base Shield.

#### 3.1 Uart Mode (Jumper set to the left two pins)

You would need to select the jumper to "U" to enter this mode, and the setting is: 9600bps, N, 8, 1, TTL output

```
// link between the computer and the SoftSerial Shield
//at 9600 bps 8-N-1
//Computer is connected to Hardware UART
//SoftSerial Shield is connected to the Software UART:D2&D3

#include <SoftwareSerial.h>

SoftwareSerial SoftSerial(2, 3);
unsigned char buffer[64]; // buffer array for data receive over serial
port
int count=0; // counter for buffer array
void setup()
{
  SoftSerial.begin(9600); // the SoftSerial baud rate
  Serial.begin(9600); // the Serial port of Arduino baud rate.
```

```

}

void loop()
{
  if (SoftSerial.available())          // if data is coming from
software serial port ==> data is coming from SoftSerial shield
  {
    while(SoftSerial.available())      // reading data into char
array
    {
      buffer[count++]=SoftSerial.read(); // writing data into
array
      if(count == 64)break;
    }
    Serial.write(buffer,count);        // if no data transmission
ends, write buffer to hardware serial port
    clearBufferArray();                // call clearBufferArray function
to clear the stored data from the array
    count = 0;                          // set counter of while loop to zero

  }
  if (Serial.available())              // if data is available on hardware
serial port ==> data is coming from PC or notebook
  {
    SoftSerial.write(Serial.read());    // write it to the SoftSerial
shield
  }
}

void clearBufferArray()                // function to clear buffer array
{
  for (int i=0; i<count;i++)
  { buffer[i]=NULL;}                  // clear all index of array with
command NULL
}

```

Open the Serial Monitor, the card information can be display as show below:

### 3.2 Wiegand Mode (Jumper Set to the Right two Pins)

You would need to select the jumper to "W" to enter this mode.

The [Wiegand demo code](#) for Seeeduino is designed to read Wiegand data in interrupt mode.

In Wiegand Mode, output data is formatted with 26bits including 24bits card info and 2 bits parity.

bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25
-	P	D																							P	
-	-	E												0	-											
-	-	D2[7..0]							D1[7..0]							D0[7..0]							-			

- PE is even bit, PO is odd bit;
- E is the data bit which was involved in even, O is the data bit which was involved in odd;
- DX[7..0] is the data bit which correspond to Mifare@ Standard & Light card read only ID;
