

# Pressure Sensors

## Gage/Unamplified

### 130PC Series

#### Temperature Compensated Sensors

#### FEATURES

- Miniature package
- Can be used to measure with vacuum or positive pressure
- Absolute and gage sensors available
- Calibrated Null and Span

- Temperature compensated for Span over 0 to 50°C
- Provides interchangeability
- Lowest cost 1, 100 and 150 psi calibrated and temperature compensated sensor

#### 136PC SERIES PERFORMANCE CHARACTERISTICS at 10.0 ±0.01 VDC Excitation, 25°C

	Min.	Typ.	Max.	Units
Excitation	---	10	16	VDC
Null Offset	-1	0	+1	mV
Null Shift, 25° to 0°, 25° to 50°C	---	±2.0	±4.0	mV
Sensitivity Shift, 25° to 0°, 25° to 50°C	---	±1.5	±3.0	%Span
Repeatability & Hysteresis	---	±0.15	---	%Span
Response Time	---	---	1.0	msec
Input Resistance	---	6.8 K	---	ohms
Output Resistance	---	4.0 K	---	ohms
Stability over One Year	---	±0.5	---	%Span
Weight	---	5	---	grams

#### ENVIRONMENTAL SPECIFICATIONS

Operating Temperature	-40° to +85°C (-40° to +185°F)
Storage Temperature	-55° to +125°C (-67° to +257°F)
Compensated Temperature	0° to +50°C (32° to +122°F)
Shock	MIL-STD-202, Method 213 (150 g, half sine, 11 msec)
Vibration	MIL-STD-202, Method 204 (10 to 2000 Hz at 20 g)
Media	P2 port Wetted materials: polyester housing, epoxy adhesive, silicon, borosilicate glass, and silicon-to-glass bond*
	P1 port Dry gases only

\* Liquid media containing some highly ionic solutions could potentially neutralize the chip-to-glass tube bond.

## Gage/Unamplified

130PC Series

### ELECTRICAL CONNECTIONS

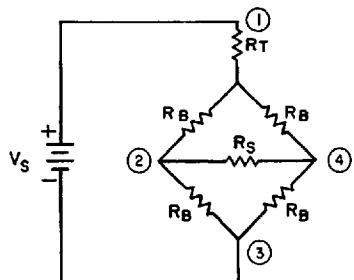

#### Voltage Excitation

#### NOTES

1. Circled numbers refer to sensor termination.
2.  $V_O$  changes with pressure difference.
3.  $V_O = V_2 - V_4$  (referenced to pin 3).
4. Current excitation provides reduced sensitivity variation with temperature.

### INTERNAL CIRCUITRY

#### NOTES

1. Circled numbers refer to sensor termination.
2.  $V_O = V_2 - V_4$  (referenced to pin 3).
3.  $R_B$  = Strain gage resistors ( $\sim 5.0$  k $\Omega$ ).
4.  $R_T$  = Sensitivity temperature compensation resistor.
5.  $R_S$  = Sensitivity calibration resistor.

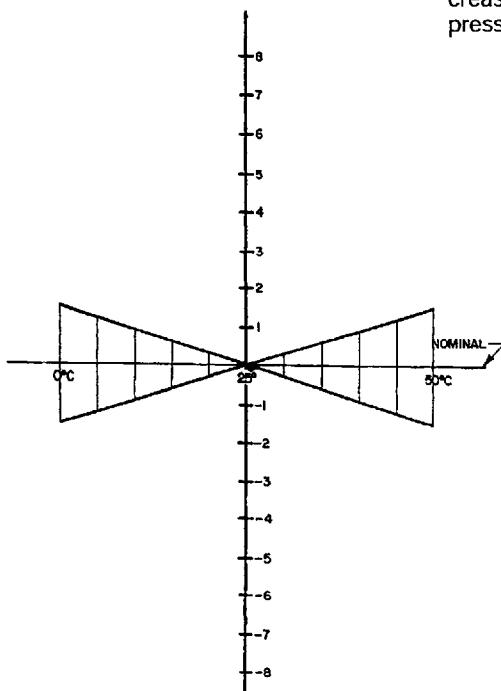

Unamplified

When a positive pressure is applied to port P2, the differential voltage  $V_2 - V_4$  (voltage at pin 2, with respect to ground, increases and voltage at pin 4 decreases) increases linearly with respect to the input pressure. When a vacuum pressure is pulled at port P2 (or positive pressure applied to port P1) the voltage  $V_2 - V_4$  decreases linearly with respect to the input pressure.

### SENSITIVITY SHIFT

The diagram at right illustrates how sensitivity shift relates to temperature. Note that the maximum shift occurs at temperature extremes. Therefore, if a sensor is not exposed to the entire temperature range, the maximum sensitivity shift will actually be less than the value specified.

SENSITIVITY SHIFT (% F.S.O.)

# Pressure Sensors

## Absolute/Unamplified

130PC Series

### ELECTRICAL CONNECTIONS

#### Voltage Excitation

### INTERNAL CIRCUITRY

### NOTES

1. Circled numbers refer to sensor termination.
2.  $V_o$  changes with pressure difference.
3.  $V_o = V_2 - V_4$  (referenced to pin 3).
4. Current excitation provides reduced sensitivity variation with temperature.

### NOTES

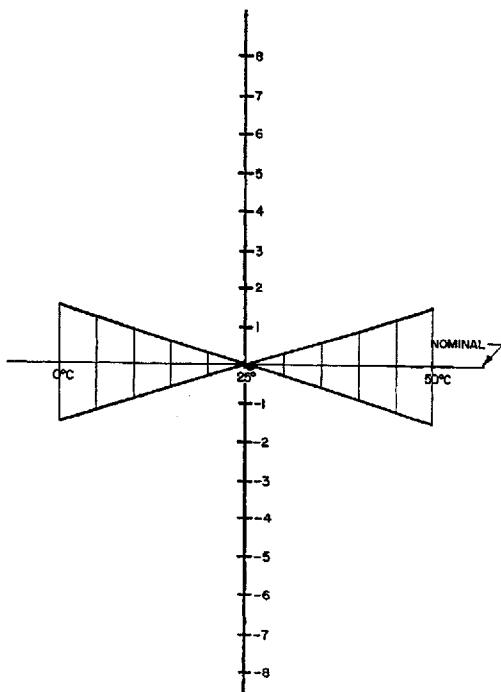

1. Circled numbers refer to sensor termination.
2.  $V_o = V_2 - V_4$  (referenced to pin 3).
3.  $R_B$  = Strain gage resistors ( $\sim 5.0 \text{ k}\Omega$ ).
4.  $R_T$  = Sensitivity temperature compensation resistor.
5.  $R_S$  = Sensitivity calibration resistor.

When input pressure increases above 0 psia, voltage at pin 2 will decrease and voltage at pin 4 will increase with respect to ground (pin 3). This causes the output voltage, defined as the differential voltage  $V_2 - V_4$ , to decrease linearly (become more negative).

### SENSITIVITY SHIFT

The diagram at right illustrates how sensitivity shift relates to temperature. Note that the maximum shift occurs at temperature extremes. Therefore, if a sensor is not exposed to the entire temperature range, the maximum sensitivity shift will actually be less than the value specified.
